

## Light Curing

Benefits, Adhesives  
and Curing Lamps

Curing of microswitch sealing with DELOLUX 202

# Durability at the speed of light

## Light curing – the fast way to a perfect bond

Short cycle times, smoothly running processes and reliable products are essential criteria in industrial serial manufacturing. DELO's light-curing adhesives ideally exceed these expectations. The products are characterized by reliable function and fast curing in seconds. The bonding process is easy to integrate into production processes.

Bonding has successfully established itself as an outstanding and material-friendly joining method in a wide variety of industries. Without DELO's light-curing adhesives, it would not be possible to produce mobile phones, smart cards, CCM cameras or modern shower enclosures as efficiently and effectively as we know them today.

You can find many light curing processes on

#### Clear advantages of DELO's light curing adhesives:

Advantages of light curing	Your benefit	
Fast curing in seconds	Short cycle times, high output and reproducibility	Page 4
Curing on demand	Adhesive cures after irradiation with the required wavelength and thus enables precise positioning and fixing of the components to be bonded	Page 5
Outstanding optical properties	Adhesive features optical functions, e.g., thanks to the matched index of refraction	Page 6
Innovation	New construction and design possibilities, e.g., thanks to the high transparency	Page 7
Miniaturization	Joining of tiny components when screwing is not possible	Page 8
High reliability	Reliable function over the entire lifetime of the component	Page 9
Simple processing	One-component, no mixing systems required	Page 10
Excellent adhesion	Outstanding strength over the entire lifetime of the component	Page 11
Low temperature stress	Joining of temperature-sensitive components, increased flexibility in the selection of component materials	Page 5, 8
Product types with secondary curing mechanism available	Curing of adhesive in shadowed areas, for example by heat, humidity or anaerobic curing	Page 5, 6, 11

Chip modules for smart cards.  
The revolving, high-viscous dam material  
encloses the low-viscous fill material.  
(Adhesive colored magenta in the figure)

# Light curing = Fast curing in seconds

## Dam & Fill chip encapsulation

In the production of chip modules for smart cards, the contacted chip is first encircled by a high-viscous adhesive (dam), that is subsequently filled with a low-viscous chip encapsulant (fill). The adhesive can be applied with systems provided by Mühlbauer or Ruhlmat.

**Mühlbauer**  
High Tech International

**ruhlmat**  
solutions for your needs.

Both DELO KATIOBOND Dam&Fill adhesives are then cured in one go with the DELOLUX 820/365 curing lamp.

### Technical properties of DELO KATIOBOND Dam & Fill

- High ion purity
- Dam & Fill encapsulants can be processed wet in wet, that means that the dam does not have to be cured first
- Dam & Fill adhesives form a chemically homogeneous unit
- Tension-equalizing or hard products for various requirement profiles
- Also suitable for glob top

Advantages of light curing	Your benefit
High production capacity	Encapsulation of up to 40,000 modules/h
Quality	Steady dispensing results even when using showerhead dispensers
Optimized production flow	In-line process from the blank tape to the finished module
Operational reliability	Requirements of the ISO specification are exceeded

16-way dispenser head for simultaneous  
adhesive dispensing on 16 modules  
© Scheugenpflug AG

### Fast curing in seconds – further examples:

- Bonding of miniloudspeakers
- Bonding of compact camera modules
- Bonding of lenses into LED packages

We have been collaborating with DELO for more than 20 years. We use DELO KATIOBOND Dam & Fill adhesives to produce our smart card modules as they cure fast in seconds and enable short cycle times. The innovative and reliable products help us achieve our goals as technology and quality leader.

Peter Stampka, Director Marketing,  
ChipCard & Security, Infineon Technologies AG

Active alignment process of camera modules:  
dispensing – alignment – light fixing – heat curing  
(Adhesive colored magenta in the figure)

# Light curing = Curing on demand

## Bonding of compact camera modules

Optical components, such as lenses and image sensors, are precisely aligned using DELO DUALBOND. The adhesive remains liquid during alignment. As soon as the component has reached the position for optimal image quality, the adhesive is quickly fixed within seconds by exposure to light using DELOLUX LED curing lamps specifically adapted to this process. Subsequent final curing by heat proceeds at just +80 °C.

### Technical properties of DELO DUALBOND

- Fast fixation by UV light in less than 1 second
- Curing at low temperatures:  
Final curing possible at +80 °C
- Excellent adhesion to plastics, such as PBT, FR4, etc.
- Low outgassing, low shrinkage
- Good temperature stability
- Good resistance to climatic changes, humidity and in salt spray test
- Halogen-free according to IEC 61249-2-21

Advantages of light curing	Your benefit
Increased production capacity	Reliable fixing in less than 1 s (depending on component) enables short cycle times
Optimized process flow	Curing at low temperatures (at only +80 °C) makes possible the bonding of temperature-sensitive components
Process reliability	Unchanging, low shrinkage leads to high yield
High efficiency	Low energy consumption

Compact camera module for smartphones

### Curing on demand – further examples:

- Fixing and bonding of optical components such as lasers or sensors
- Applications in precision engineering

Thanks to DELO DUALBOND, it is now also possible to bond temperature-sensitive components and cure shadowed areas in a fast and highly reliable process. These adhesives are perfectly suited for the active alignment process by providing fast light curing with secondary temperature curing at only +80 °C. We often recommend that customers use DELO DUALBOND adhesives because we know, they work without fail!

Andre By, Chief Technology Officer,  
Automation Engineering Incorporated

# Light curing = Outstanding optical properties

## Bonding of displays and touch panels

Light-curing adhesives are more than just a joining element.

When bonding touch panel displays for smartphones, tablet PCs and industrial displays, the adhesive also features optical functions: It fills the air gap between touch panel and display. The adhesive's adapted index of refraction prevents undesirable reflections and allows readability even under direct sunlight.

### Technical properties of DELO PHOTOBOND and DELO DUALBOND display adhesives

- High transparency
- Tension-equalizing
- Secondary curing mechanism (humidity) for shadowed areas, for example under black print on the display glass
- Fast, reliable and durable connection of various materials

Advantages of light curing	Your benefit
Functionality	Improved optical properties of the displays
Short innovation cycles	Faster development of new products and designs compared to tapes
Quality	Increased ruggedness, impact and vibration resistance of touch panel and display, no contamination in the air gap
Prolonged lifetime	Improved shock and vibration behavior

*LCD with protective glass cover:  
On the right side, reflections are visible due to the air gap between LCD and glass cover.  
On the left side, the gap is filled with DELO's index-matched adhesive.*

### Outstanding optical properties – further examples:

- Protection of glass covers of industrial displays against extreme stress
- Bonding of lenses into LED packages
- Glass bonding: shower enclosures, glass jewelry, flacons

Radtech Europe Innovation Award 2011 for the development of light-curing, transparent adhesives for display bonding.

RadTech Europe Association,  
October 2011

# Light curing = Innovation

## Bonding of door hinges for glass shower enclosures

DELO PHOTOBOND is used in mixed glass bondings for shower enclosures, as an example, to join door hinges made of stainless steel to glass panels. The adhesive is cured with DELOLUX LED area modules. Intensity and irradiation time can be controlled. The irradiation time can precisely be set by simply switching the lamp on and off. As a result, the LED does not age or consume current during the non-irradiation phase.

### Technical properties of DELO PHOTOBOND

- Reliable adhesion to glass, stainless steel, and anodized aluminum
- Invisible, yellowing-resistant and light-fast
- Humidity-resistant
- Equalization of thermal tensions between glass and metal, impact-resistant

Advantages of light curing	Your benefit
New design possibilities	Esthetical and easy-to-clean designs
Cost-efficient production	Omission of boreholes and screws
Quality	Positively tested acc. to DIN EN 14428 with more than 250,000 opening/closing cycles

Bonding of door hinges made of stainless steel for glass shower enclosures. © Duscholux AG

The world market leader Duscholux, Switzerland, uses DELO's light-curing adhesives to bond its shower enclosures.

We decided to use bonding technology as joining methods in order to provide our customer with modern appearance and innovative design with user-friendly cleaning properties. The invisible and yellowing-resistant DELO PHOTOBOND adhesives are ideal for this application.

Guido Riegger, Development Manager,  
Duscholux AG

### Innovation – further examples:

- Bonding of organic solar cells
- Encapsulation of OLED displays
- Bonding of connection elements/ONSERT®

Eight individual components are bonded to assemble miniloudspeakers for mobile phones, dictating machines, etc. Light-curing adhesives are used for most of them.

# Light curing = Miniaturization

## Bonding of miniloudspeakers for mobile phones

Today's mobile phones include two to three high-performance miniloudspeakers. The individual components, such as membranes, coils, or covers, are bonded with DELO PHOTOBOND adhesives which are cured with specifically adapted high-power DELOLUX LED lamps.

### Technical properties of DELO PHOTOBOND

- Fast curing in less than 1 second
- Good adhesion to various materials, such as metal and plastic
- Very good temperature and humidity resistance
- High flexibility and impact resistance
- Light curing: No thermal stressing of the sensitive membranes

Advantages of light curing	Your benefit
More flexible production	Easy adaptation of the bonding process over many product generations
Quality	Loudspeakers bonded with DELO PHOTOBOND are characterized by superior acoustic quality over their entire lifetime
Increased production capacity	Short cycle times allow production of up to 6,000 loudspeakers per hour on one system
Production reliability	In-process check of the exact adhesive application thanks to the fluorescence of the adhesive
Optimized process flow	Loudspeakers can be fully tested directly after adhesive curing, buffer stock not necessary therefore

Comparison of an outdated loudspeaker with today's models: The performance density of modern miniloudspeakers clearly increased while the size was reduced  
© Knowles Electronics Austria GmbH

### Miniaturization – further examples:

- Smart label applications
- Bonding of compact camera modules

We are the market and innovation leader in mobile phone loudspeakers and have successfully been collaborating with DELO for more than 20 years. Here, world market leader meets world market leader! We can rely on DELO when we develop new products. They always supply us with innovative adhesives that fulfill our individual needs for mobile acoustic products.

Wolfgang Suete, Process Engineer,  
Knowles Electronics Austria GmbH

# Light curing = High reliability

Cast microswitches  
(adhesive colored  
magenta in the figure)

## Casting of automotive microswitches

When bonding electronic automotive components such as microswitches, relays or sensors, special adhesives are in demand: they must seal the components against temperatures, pressure, humidity or aggressive media. Open contact areas at the housing must be reliably covered to protect the entire component from corrosion.

### Technical properties of DELO KATIOBOND

- Excellent adhesion to plastic, metal, and glass
- High flexibility even at low temperatures
- Very good flow and wetting behavior
- Resistant to media, humidity, temperatures, and shocks
- High corrosion resistance

Advantages of light curing	Your benefit
Quality	Reliable function of safety-relevant components even after years of use
Process reliability	Fast curing allows functional tests directly in the system
Increased efficiency	Technically and economically ideal solution compared to two-component or heat-curing adhesives

Casting of connector pins for operator and control devices in automotive air conditioning systems  
© Behr-Hella Thermocontrol GmbH

Behr-Hella Thermocontrol produces operator and control devices for automotive air conditioning systems. They use light-curing adhesives to cast electrical pins.

Important requirements on the adhesive include that the component is reliably sealed against contaminations and humidity. DELO KATIOBOND is ideal for this purpose.

Heinz Sträter, Production Engineer,  
Behr-Hella Thermocontrol GmbH

### High reliability – further examples:

- Smart card encapsulation
- Bonding and sealing of mobile phone displays

# Light curing = Simple processing

## Bonding of connection elements

In the aircraft and automotive industries more and more carbon-fiber-reinforced plastics (CFRP) are used. Boreholes are omitted to prevent damage to the material when attaching connection and fixing elements. Instead, clips or thread inserts covered in transparent plastic are bonded to the CFRP.

The ONSERT® method jointly developed by DELO and BÖLLHOFF (supplier of mechanical connection elements, such as rivets and screws) has many advantages over other joining methods.

### Technical properties of DELO PHOTOBOND

- Excellent adhesion to many plastics, metals, and glass
- Tension-equalizing
- High long-term and media resistance

Advantages of light curing	Your benefit
Decrease in production costs	Easier handling compared to two-component or heat-curing adhesives
Increased production capacity	Fast curing in seconds for short cycle times
Production reliability	A high degree of automation is possible
Continuously high level of the product properties	Unlike rivets, bonding does not weaken or damage the component structures
New design possibilities	In contrast to welded elements, bonded fixing elements can flexibly be attached and are not apparent on the visible side

© Böllhoff

### Simple processing – further examples:

- Bonding of faceplates of household appliances (ovens, dishwashers, washing machines)
- Bonding of stop rails and door hinges of shower enclosures – instead of boreholes
- Bonding of automotive cameras

The ONSERT® joining method is an excellent combination of innovative bonding technology and connection elements.

Short cycle times, a simple process with a high degree of automation and adhesive curing in just seconds enable simple and reliable handling. This is a fantastic creation of DELO and BÖLLHOFF.

Michael Stumpf, Product Manager,  
Böllhoff Verbindungstechnik GmbH

to an aluminum housing  
© ebm-papst GmbH & Co. KG

# Light curing = Excellent adhesion

## Bonding of electric motors

Electric motors are getting more and more compact and efficient. The degree of efficiency of small motors is continuously increasing.

DELO-ML DB adhesives connect the individual components in seconds, save weight, equalize tensions and, unlike anaerobic-curing competitive products, provide high strength even at high torque.

### Technical properties of DELO-ML DB

- Dual-curing: Curing by light and under exclusion of oxygen (anaerobic)
- Very good resistance to media in the engine compartment including oil, gasoline, and Diesel
- Normal temperature range of use up to +180 °C
- Tension-equalizing
- Very high impact resistance
- Excellent adhesion to smooth metal surfaces

Advantages of light curing	Your benefit
Increased operational reliability and longer lifetime	Metals with dissimilar coefficients of expansion and even larger magnets are bonded with high strength
Optimized production flow	Preliminary light fixation enables immediate initial strength and saves mechanical component fixtures
Increased efficiency	Anaerobic adhesive curing in shadowed areas reduces energy costs and saves expensive process steps

The steel stator is bonded to an aluminum housing (see figure above)  
© ebm-papst GmbH & Co. KG

### Excellent adhesion – further examples:

- Bonding of lenses into LED packages
- Bonding of connection elements/ONSERT®
- Bonding of chips to RFID labels

We bond with the dual-curing DELO-ML DB as it provides clearly better strength in torque tests than the previously used adhesive.

*Daniel Rauer, Project Team Leader, Industrial Drive Development, ebm-papst GmbH & Co. KG*

In addition, it is not necessary to mechanically fix the components during anaerobic curing thanks to the preliminary light fixation.

Precise and bubble-free adhesive dispensing with  
DELO-DOT PN3 and DELO FLEXCAP.

# Adhesive dispensing

In order to better utilize the advantages of light curing in production, including miniaturization, maximum reliability and extremely fast processes, DELO has developed

complementary dispensing technology, such as the DELO-DOT PN3 jet valve and DELO FLEXCAP.

## DELO-DOT PN3 microdispensing valve – Precise, compact and light-weight

The pneumatic DELO-DOT PN3 microdispensing valve is precise, fast and compact. It has an operating frequency of up to 330 Hz (drops per second). This unique system is made to be robust due to its modular design. This design allows the dispensing valve to be easily

disassembled into its single parts. The fluid system is strictly separated from the actuator. This avoids time-consuming cleaning, and the valve can be put into operation again quickly. The actuator has an extremely long lifetime of more than 1 billion cycles.

## DELO FLEXCAP cartridge system with integrated fill level sensor in the pressure tank

A flexible, hermetically tight foil replaces the conventional cartridge piston. As a result, adhesives can be stored, transported and dispensed without bubbles. The cartridge system which is free of trapped air enables the highest dispensing reliability, precision and maximum emptying. DELO FLEXCAP is available in 10 ml and 30 ml container. The fill level sensor of the pressure tank for DELO FLEXCAP provides benefits for fully automated production. Integrated sensors transmit a signal that indicates when the cartridge is nearly empty and again when it is completely empty. As a result, the user can prepare a new cartridge in time to minimize downtime.

### Advantages at a glance:

- Process reliability thanks to bubble-free dispensing
- Reproducible processes with a high yield rate
- Easy to integrate into every production system
- Cost savings through reduced waste, minimized downtime, and maximum emptying of the cartridges
- The air-tight cartridge enables easy and cost-efficient transport

All DELO products are developed and produced in Germany, ensuring the highest quality of design and manufacture.
